

ICN Infrastructure Tools and Services – Working Definitions

Terminology	Definition
Clinical Query Portal Enhancements	Improvements to the existing clinical query portal including approaches to simplify access, incorporating new content such as access to care profiles, and displaying the patient’s providers.
In-Context Notifications and Alerting	Inclusive of a range of alert types sent to the point of care or to a care manager that pertains to critical information about a patient, identifies care gaps, indicates post-discharge follow-up care has not occurred, etc.
Care Profile View	The care profile provides, in one readily viewable place, the key characteristics of a patient and their current medical status. Key elements in the care profiles could include patient demographics, most recent clinical alerts, summary of recent hospital encounters – diagnoses and procedures, visit dates, subscribing providers, and the existence of a current care plan.
Data Router	The router is a service that includes key functionality to support connectivity, consent management, data routing to other services or data consumers, and determine patient-provider relationships. These approaches may rely on connectivity through a health system, through a hosted EHR, directly to the practice, or via an administrative network.
Standardized Risk Stratification Tools	Deployment of one or more centralized risk stratification methodologies to support stratification of patients initially using HSCRC case mix data housed in CRS but expanding to include broader data sets. Predictive risk score will be shared through a range of tools, including the query portal and ENS.
